This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ79917 to AAZ80766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of

HPC2, the human homologue of which is four on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human prostate cancer (HPC)2 nucleic antibodies, useful for treatment and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides methods of identifying antifungal agents using the coding and protein sequences of several yeast genes. These are essential for the germination and proliferation of Saccharomyces cerevisiae, and include YKR081C, YFR003C, YGR277C, YGR278W, YKR071C, YKR079C and YKR083C. The sequences can also be used to identify compounds for use as herbicides, insecticides and anti-proliferation drugs which can be used in the treatment of cancer, psoriasis and restenosis. This is because they can be used to identify plant, insect and human homologues

Antibodies which bind HJNCT can be used for diagnosis of disorders associated with HJNCT expression or to monitor patients being treated with HJNCT, agonists, antagonists or inhibitors of HJNCT. Assays are preferably carried out on loady fluids from a patient using radioimmunoassay, enzyme linked immunosorbent assays or fluorescent activated cell sorting assays. Polynucleotides encoding HJNCT are also used in hybridisation assays to determine absence, presence or excess expression of HJNCT and to monitor regulation of HJNCT levels during disease therapy.

CC insert. The invention provides a method for increasing the resistance cc insert. The invention provides a method for increasing the resistance cc of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of cc inserting onto or into the core protein a stabilising polypeptide of cc sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, CC Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not cc encoding the stabilising polypeptide can be linked onto or inserted into CC encoding the stabilising polypeptide can be linked onto or inserted into cc invention are more resistant to degradation by proteases and, thus, have classed for treating autoimmune diseases, cancer and inflammation. In cc particular, the core protein may be an Ixappab regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein cc which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in cut of the core protein as in vivo imaging.

ENA 1 protein is used to stably maintain episomes containing EBV origin of replication (orip) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy,
                                                                                                                                                                                                                                                                                                                                    2387

                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the Epstein Barr nuclear antigen. It is used to produce bait vectors of the invention. The specification describes a compositions and methods for a genetic system of detecting protein-protein interactions in a mammalian host cell. The system comprises bait and test, both containing selection genes, and viral origin of replications which require bound viral replication proteins to effect replication. The compositions is useful for detecting an interaction between a bait protein and a test protein. It is useful in a mammalian two-hybrid system for detecting protein-protein interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition for detecting protein-protein interactions in a mammalian two hybrid system comprises bait and test vector which consist of selection gene, vector viral origin of replication and fusion gene -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
